

Final Project - Preliminary Experimental Results

AutoML Fall 2021

Leiden University

Previously, you have handed in a project proposal with some ideas about what you want to do in your project. At this point in time, you should be making quite some progress, and already have a first version of the experimental section with experimental results. This version should be able to be integrated into your final report and should include:

- A clear description of the experimental setup, rendering the work reproducible by just reading this section
- Figure(s): plot(s), table(s), etc. - *no screenshots of console outputs*
- Appropriate captions for these visualizations
- A description of what we observe in the figures and what we learn from them
- A GitHub link or LIACS Gitlab link to the code and instructions on how to run it (in a README)

The preliminary experiments section that you hand in should fill 2 to 3 pages using the project **template** (*project_template.zip*)—with reasonably-sized figures and excluding references. The deadline for handing in this draft is **December 3, 2021, 23:59 CET**. Again, this deadline is strict, so make sure to start working on it early.
